ANNUAL DIABETES REVIEW

Patient: Robert Patel

DOB: 1964-11-03 (age 59)

NHS Number: 999 600 0006

Address: 27 Linden Grove, Birmingham, B14 7HJ

Active Medical Conditions:

- Type 2 diabetes mellitus (ICD-10: E11.9) — diagnosed 2018-06-12
- Hypertension (ICD-10: I10) — diagnosed 2016-02-20
- Obesity (BMI 32) (ICD-10: E66.9)

Current Medications:

- Metformin 1 g BD — started 2018-07-01
- Ramipril 5 mg OD — started 2016-03-15
- Atorvastatin 20 mg ON — started 2020-04-22

Allergies: NKDA — no known drug allergies recorded.

Examination: BP 142/86, HR 78. Weight 96 kg (BMI 32.4). Foot examination unremarkable. No peripheral neuropathy detected. Fundoscopy via retinal screening service: no diabetic retinopathy noted on Sept 2023 screen.

Investigations (today): HbA1c 8.6% (target <7.0%); eGFR 68 mL/min/1.73m²; ACR 2.1 mg/mmol; total cholesterol 4.8, LDL 2.9; ALT 32, AST 28.

Assessment: Glycaemic control remains suboptimal on metformin monotherapy despite lifestyle counselling. Mr Patel reports good adherence to metformin. BP at upper end of target. Renal function stable.

Plan:

- Refer to diabetes clinic for treatment escalation — consider second-line agent (SGLT2 inhibitor or DPP-4 inhibitor)
- Continue metformin 1 g BD
- Reinforce lifestyle: weight reduction target 5%, increase activity
- Recheck HbA1c at diabetes clinic appointment
- Increase ramipril to 10 mg OD given persistent BP >140/85
