HYPERTENSION REVIEW

Patient: Robert Patel

DOB: 1964-11-03 (age 59)

NHS Number: 999 600 0006

Reason for visit: Routine 6-month BP check; patient also reports occasional dizziness on standing, particularly first thing in the morning.

Active Medical Conditions:

- Type 2 diabetes mellitus (ICD-10: E11.9)
- Hypertension (ICD-10: I10)
- Obesity (ICD-10: E66.9)

Current Medications (per practice record):

- Metformin 1 g BD
- Gliclazide 80 mg BD
- Ramipril 10 mg OD
- Atorvastatin 20 mg ON

Allergies: NKDA.

Examination: BP supine 128/76, standing 112/68 (postural drop 16 mmHg). HR 74. Weight 94 kg. No oedema. Capillary glucose today 5.2 mmol/L (fasting).

Assessment: BP control good. Postural drop with morning dizziness is suggestive of overtreatment vs intercurrent dehydration. Patient denies recent illness. Capillary glucose suggests no current hypoglycaemia but morning episodes possible.

Plan:

- Continue current medications
- Advised increased fluid intake, particularly in warm weather
- Home BP diary for two weeks, return for review
- If postural symptoms persist, consider reducing ramipril
- HbA1c due at next routine review (October)
