

Manchester Royal Infirmary — Emergency Department

Date: 04 Apr 2024

DISCHARGE SUMMARY

Patient: Margaret Thompson

DOB: 1954-08-15 (age 69)

NHS Number: 999 100 0001

Address: 14 Beech Avenue, Manchester, M14 5RT

Presentation: Brought in by ambulance with acute shortness of breath at rest, worsening over 48 hours. Unable to lie flat. Productive cough, no fever.

Diagnosis: Acute decompensated heart failure (ICD-10: I50.21) on background of chronic HFrEF. Likely precipitated by suboptimal compliance with new furosemide dose.

Examination on arrival: SpO2 88% on room air, RR 28, BP 156/94, HR 104. Bibasal crackles to mid-zones. Bilateral pitting oedema to knees. CXR: pulmonary oedema with bilateral pleural effusions.

Treatment given: IV furosemide 80 mg, oxygen via nasal cannulae, GTN infusion. Symptoms improved over 6 hours. Admitted to AMU overnight for monitoring; discharged following day.

Allergies: NKDA.

Discharge medications:

- Furosemide 80 mg OD — continue at increased dose from cardiology review
- Ramipril 5 mg OD — continue
- Bisoprolol 5 mg OD — continue
- Spironolactone 25 mg OD — continue
- Atorvastatin 40 mg ON — continue
- Metformin 1 g BD — continue

Follow-up: GP review within 7 days. Heart failure nurse contact within 2 weeks. Cardiology clinic follow-up as previously arranged.
