OUTPATIENT CLINIC LETTER

Patient: Daniel Ofori

DOB: 1968-03-22 (age 55)

NHS Number: 999 200 0002

Dear Dr Acacia,

I reviewed Mr Ofori today in the diabetes outpatient clinic, referred for sub-optimal glycaemic control.

History: Type 2 diabetes diagnosed 2019. Currently on metformin 1 g BD — tolerated well, no GI side effects. Reports continued polyuria and nocturia. Has attempted dietary modification with limited success; weight unchanged since May review. No symptoms suggestive of macrovascular complications.

Examination: Weight 92 kg, BMI 31.2, BP 144/88. Peripheral pulses preserved. Sensation intact to monofilament.

Investigations: Repeat HbA1c 8.7% (72 mmol/mol) — worsened from May despite stated adherence. eGFR 76, ACR 2.1. Lipids stable.

Impression: Type 2 diabetes with suboptimal control on metformin monotherapy. Renal function preserved.

Plan:

- Add gliclazide 40 mg OD — titrate as required
- Continue metformin 1 g BD
- Reinforce lifestyle measures — referred to community weight management programme
- Repeat HbA1c, U&E, lipids in 3 months
- Review in clinic at 6 months

Yours sincerely,

Dr R. Patel, Consultant Diabetologist
