CKD ANNUAL REVIEW

Patient: Christopher Walsh

DOB: 1959-09-27 (age 64)

NHS Number: 999 130 0013

Address: 8 Riverdale Crescent, Sheffield, S7 1QH

Active Medical Conditions:

- **Chronic kidney disease stage 3a** (ICD-10: N18.30) — diagnosed 2021-08-15
- Type 2 diabetes mellitus (ICD-10: E11.9) — diagnosed 2014-06-04
- Hypertension (ICD-10: I10) — diagnosed 2011-09-22
- Hypercholesterolaemia (ICD-10: E78.0)

Current Medications:

- Metformin 1 g BD — started 2014-07-01
- Ramipril 10 mg OD — started 2011-10-12 (dose increased 2019)
- Amlodipine 5 mg OD — started 2018-03-04
- Atorvastatin 40 mg ON — started 2015-04-20

Allergies: NKDA — no known drug allergies recorded.

Examination: BP 142/86, HR 74 regular. Weight 84 kg (BMI 28.1). No peripheral oedema. Foot examination unremarkable.

Investigations (today): eGFR 52 mL/min/1.73m² (stable from 50 in July 2023); creatinine 128 µmol/L; ACR 4.2 mg/mmol (mild albuminuria, A2 category); HbA1c 7.4%; potassium 4.6; bicarbonate 23; urinalysis: no blood, trace protein.

Assessment: CKD stage 3a with mild albuminuria, stable. T2DM moderately controlled. BP slightly above target for CKD/diabetes. ACEi-treated.

Plan:

- Continue current medications
- Lifestyle reinforcement: low salt, weight reduction target 5%
- Repeat U&E, ACR, HbA1c in 6 months
- Consider amlodipine uptitration to 10 mg if BP persistently >140/85 at next review

- Annual flu vaccine recommended (October)
